# ABOUT THIS GUIDE

**PURPOSE** This guide gives specific information on how to operate and use the management functions of the switch.

**AUDIENCE** The guide is intended for use by network administrators who are responsible for operating and maintaining network equipment; consequently, it assumes a basic working knowledge of general switch functions, the Internet Protocol (IP), and Simple Network Management Protocol (SNMP).

**CONVENTIONS** The following conventions are used throughout this guide to show information:

**NOTE:** Emphasizes important information or calls your attention to related features or instructions.

**CAUTION:** Alerts you to a potential hazard that could cause loss of data, or damage the system or equipment.

# CLI Management

The following description is the brief of the network connection.

--RJ-45 cable is used for connecting a terminal or terminal emulator to the Managed Switch's RJ-45 port to access the command-line interface.

-- Attach the RJ-45 serial port on the switch's front panel to the switch for console configuration.

-- Attach the other end of the DB-9 cable to an ASCII terminal emulator or PC Com-1, 2 port. For example, PC runs Microsoft Windows HyperTerminal utility.

-- At "Com Port Properties" Menu, configure the parameters as below: (see the next section)

Baud rate	115200
Stop bits	1
Data bits	8
Parity	N
Flow control	none

## 1-1 Login

The command-line interface (CLI) is a text-based interface. User can access the CLI through either a direct serial connection to the device or a Telnet session. The default user and password to login into the Managed Switch are listed below:

Username: admin

Password: <none>

**Note: <none> means empty string**

After you login successfully, the prompt will be shown as "<sys\_name>#". See the following two figures. It means you behave as an administrator and have the privilege for setting the Managed Switch. If log as not the administrator, the prompt will be shown as "<sys\_name>>", it means you behave as a guest and are only allowed for setting the system under the administrator. Each CLI command has its privilege

Username: admin

Password:

## 1-2 Commands of CLI

The CLI is divided into several modes. If a user has enough privilege to run a particular command, the user has to run the command in the correct mode. To see the commands of the mode, please input “?” after the system prompt, then all commands will be listed in the screen. The command modes are listed as belows:

Command Modes

MODE	PROMPT	COMMAND FUNCTION IN THIS MODE
exec	<sys_name>#	Display current configuration, diagnostics, maintenance
config	<sys_name>(config)#	Configure features other than those below
Config-if	<sys_name>(config-interface)#	Configure ports
Config-if-vlan	<sys_name>(config-if-vlan)#	Configure static vlan
Config-line	<sys_name>(config-line)#	Line Configuration
Config-impc-profile	<sys_name>(config-impc-profile)#	IPMC Profile
Config-snmp-host	<sys_name>(config-snmp-host)#	SNMP Server Host
Config-stp-aggr	<sys_name>(config-stp-aggr)#	STP Aggregation
Config-dhcp-pool	<sys_name>(config-dhcp-pool)#	DHCP Pool Configuration
Config-rfc2544-profile	<sys_name>(config-rfc2544-profile)#	RFC2544 Profile

Commands reside in the corresponding modes could run only in that mode. If a user wants to run a particular command, the user has to change to the appropriate mode. The command modes are organized as a tree, and users start to in enable mode. The following table explains how to change from one mode to another.

## Change Between Command Modes

MODE	ENTER MODE	LEAVE MODE
exec	--	--
config	Configure terminal	exit
config-interfcae	Interface <port-type> <port-type-list>	exit
config-vlan	Interface vlan <vlan_list>	exit

## dot1x

IEEE Standard for port-based Network Access Control

### SYNTAX

**no** dot1x authentication timer inactivity

**no** dot1x authentication timer re-authenticate

**no** dot1x feature { [ guest-vlan ] [ radius-qos ] [ radius-vlan ] }

#### Parameter

<b>authentication</b>	Authentication
<b>feature</b>	Globally enables/disables a dot1x feature functionality
<b>guest-vlan</b>	Guest VLAN
<b>max-reauth-req</b>	The number of time a Request Identity EAPOL frame is sent without response before considering entering the Guest VLAN.
<b>re-authentication</b>	Set Re-authentication state
<b>system-auth-control</b>	Set the global NAS state
<b>timeout</b>	timeout
<b>timer</b>	timer
<b>inactivity</b>	Time in seconds between check for activity on successfully authenticated MAC addresses.
<b>re-authenticate</b>	The period between re-authentication attempts in seconds
<b>guest-vlan</b>	Globally enables/disables state of guest-vlan
<b>radius-qos</b>	Globally enables/disables state of RADIUS-assigned QoS.
<b>radius-vlan</b>	Globally enables/disables state of RADIUS-assigned VLAN.
<b>supplicant</b>	The switch remembers if an EAPOL frame has been received on the port for the life-time of the port. Once the switch considers whether to enter the Guest VLAN, it will first check if this option is enabled or disabled. If disabled (unchecked; default), the switch will only enter the Guest VLAN if an EAPOL frame has not been received on the port for the life-time of the port. If enabled (checked), the switch

will consider entering the Guest VLAN even if an EAPOL frame has been received on the port for the life-time of the port.

Help may be requested at any point in a command by entering a question mark '?'. If nothing matches, the help list will be empty and you must backup until entering a '?' shows the available options.

Two styles of help are provided:

1. Full help is available when you are ready to enter a command argument (e.g. 'show ?') and describes each possible argument.
2. Partial help is provided when an abbreviated argument is entered and you want to know what arguments match the input (e.g. 'show pr?').

# 20 CLI COMMAND REFERENCES

This chapter introduces the CLI privilege level and command modes.

- The privilege level determines whether or not the user could run the particular commands
- If the user could run the particular command, then the user has to run the command in the correct mode.

## 23.1 Privilege level

Every command has a privilege level (0-15). Users can run a command if the session's privilege level is greater than or equal to the command's privilege level. The session's privilege level initially comes from the login account's privilege level, though it is possible to change the session's privilege level after logging in.

PRIVILEGE LEVEL	TYPES OF COMMANDS AT THIS PRIVILEGE LEVEL
0	Display basic system information
13	Configure features except for login accounts, the authentication method sequence, multiple logins, and administrator and enable passwords.
15	Configure login accounts, the authentication method sequence, multiple logins, and administrator and enable passwords.

## 23.2 Command modes

The CLI is divided into several modes. If a user has enough privilege to run a particular command, the user has to run the command in the correct mode. The modes that are available depend on the session's privilege level.
